Rix PC Checkup

Give Your PC a Performance boost. For only \$35 we will advise you on how the performance of your computer can be improved, detect malware and more.

Computer slowness can be caused by lack of RAM, fragmented or full hard disk, spyware/virus or just the age of the PC.

So bring your PC in Today. You and your computer will love it!

Windows Vista Experience Rating

The Windows Experience rating is a new feature built into Windows Vista that is designed to help you better understand how well your computer will perform.

Your computer, running Windows Vista, is assigned a rating number called a "base score" that is achieved by measuring the capability of your computer's hardware (Speed of the CPU, RAM, Hard Drive and Graphics card).

The scale of the Windows Experience Index ranges from 1.0 to 5.9. A higher base score generally means that all the components your computer will perform better and faster than a computer with a lower base score.

Both our high end New PC's have an experience index rating of 5.9.

Rix PC Hints

Don't install new hardware yourself. Get us to install it for you.

The \$35 it costs for us to install it, may save you thousands of dollars when critical internal components fail due to hardware mis-installation or ESD caused damage.

Windows XP Mode for Windows 7

Use your all your Windows XP Productivity Applications in Windows 7

Microsoft has unveiled an add-on for it's upcoming operating system named "Windows 7". The "Windows XP Mode" allows users run applications designed for Windows XP in a virtual machine. The add-on creates a Windows XP virtual environment running under Windows Virtual PC (Microsoft's client virtualization technology within Windows 7).

Windows XP Mode requires processor-based virtualization support and is based on the next-generation Microsoft Virtual PC 7 technology. It has also been disclosed that Microsoft will include a fully licensed copy of Windows XP Service Pack 3 (SP3) with the add-on. That, in effect, gives Windows 7 users a way to run older applications without having to pay for another operating system license.

Windows XP Mode does not require you to run the virtual environment as a separate Windows desktop. As you install applications inside the virtual XP environment, they are published to the host (Windows 7) OS as well. That way, users can run Windows XP-based applications, like Internet Explorer 6, alongside Windows 7 applications under a single desktop.

This means that most applications that worked within Windows XP will now work in Windows 7. Windows 7 is scheduled for release in October 2009.

Family Computer System

- Intel Dual Core E1400 2.0GHz
- 1GB DDR2 Ram
- Asus P5KPL-CM Motherboard
- Dual Layer DVD-RW Burner
- Western Digital 160GB Hard Drive
